CLAIMS

1. Apparatus for reducing the electromagnetic radiation reflected from at least one object in the direction of at least one electromagnetic radiation receiver, the apparatus comprising an array, provided between each object and receiver, of at least one substantially reflective panel, each panel arranged such that the array reflects and disperses incident electromagnetic radiation away from each receiver.

2. Apparatus according to Claim 1 wherein the array of panels is attached to an outer surface of each object.

3. Apparatus according to Claim 1 or 2 wherein the panels are made of material substantially reflective to electromagnetic radiation.

4. Apparatus according to Claim 1 or 2 wherein the panels comprise a substrate having a substantially reflective coating.

5. Apparatus according to any of the preceding claims wherein at least one of the panels is substantially absorptive to electromagnetic radiation.

6. Apparatus according to any of the preceding claims wherein the panels are generally planar.

7. Apparatus according to Claims 1 to 5 wherein the panels are generally curved.

8. Apparatus according to any of the preceding claims, wherein the panels are irregular in shape.

9. Apparatus according to any of the preceding claims wherein at least one of the panels has a substantially reflective multi-faceted surface.

10. A method for reducing the electromagnetic radiation reflected from at least one object in the direction of at least one electromagnetic radiation receiver comprising the steps of:

    i) determining the direction of each electromagnetic radiation receiver from each object

ii) providing an array of at least one substantially reflective panel between each object and receiver

iii) arranging each panel to reflect and disperse incident electromagnetic radiation away from each receiver.
